Technical Assignment: Benefit Illustration Module

Please just prepare a basic application with not much focus on UI. Pick any available free template for UI.

- Set up a React application with basic UI components to display policy details.
- Implement a Node.js backend using Express to serve sample policy data through API endpoints.
- Design and implement data structures to represent policy information, including policy types, riders, and premium options.
- Develop an algorithm to calculate projected benefits based on policy parameters, premium payments, and policyholder age.

The project needs to be scalable. It should be kept in mind that we will plan to upload bulk inputs in millions for the output at a time in future. Explain a scalable approach for the same.

Note : Please copy paste the link in the browser. Clicking the link might not work.

Assignment is a very basic level calculation logic to be replicated on screen.

Backend- Node.js
Front end - React/Angular
DB: SQL / NOSQL (RDBMS preferred)

Screens: Login/Register Page, Policy Calculation page, Illustration Page
Menu: Respective menus

Notes:
1. Validations to be applied on inputs. Logic shared in excel sheet. (Total 5 validation for input)
2. For age calculation, candidates can choose the age completed birthday as age logic.
3. Inputs are provided in **Inputs** sheet. Output in **Illustrations** sheet.
4. Illustration page can contain a simple dynamic table as in the **Illustration** sheet of google doc shared. UI/UX depends on candidates choice.

Evaluation:
1. Logic should pass all validations
2. Unit tests will be add on
3. Authentication modules should be built keeping customer sensitive information like name, dob, mobile number safe. Sensitive info should be masked in the database.
4. We are focussing more on the logical part and implementation approach
5. Sensitive project level/environment specific keys etc management will be focussed upon analysis
